

## Vista Solutions Group Prepares to Release netDMS™ Version 2.13.0

**Austin, TX – December 16, 2009** *Development at Vista Solutions Group is well under way for netDMS version 2.13.0, set for release in early 2010.*

Some of the key components to the netDMS release include a new Active Directory Synchronization (ADSync) module, a new and improved Import Server, critical bug fixes, and enhanced workflow and document structure diagnostic capabilities.

The new Active Directory Synchronization (ADSync) module simplifies work processes for both administrators and end users. Through ADSync, an administrator can automatically create users and groups via Microsoft's Active Directory with the flexibility to define which users and groups are to be retrieved from the Active Directory. ADSync provides users with the convenience of a single login, utilizing the Windows username and domain name to bypass the netDMS login.

Max Yeste, Lead Developer, Vista Solutions Group, "The ADSync module comes as an outgrowth of listening to our clients and identifying ways to improve the administrative and user experience for netDMS while enhancing the operational efficiency of the product."

Improvements to Import Server include the ability to insert import records directly into the database, eliminating the overhead of the Task Dispatcher and markedly improving processing time (upwards of three to five times). Another key change to the Import Server is the addition of a monitoring tool within netDMS User Console that allows users to view all index files that have been processed as well as the progress on each file as it is being processed.

Julie McCrory, Development Manager Vista Solutions Group, "The netDMS Import Server redesign has resulted in significant performance gains and new process statistics have been added to provide more substantial feedback to the user during processing."

Enhancements made to the diagnostic reporting capabilities within both the workflow and document structure are another key element to netDMS version 2.13.0. McCrory, "The workflow and document structure diagnostic tools in netDMS are a key component of this next release. With these enhanced reporting capabilities, our clients will be able to identify issues with data and image discrepancies, further facilitating optimal operation. We are confident that the components in this release will improve the overall experience with netDMS."

Document structure diagnostics assist administrators in identifying data discrepancies related to the document table's relationship to the image content. Examples of reported issues include identification of an invalid path to the descriptor file or an incorrect page count. The total document count and the total number of documents with errors is also reported.

Content management inventory diagnostics locate physical descriptor files and images that exist on disk in the content management storage location but are missing associated content management records within netDMS. Additionally, the diagnostic report can display specific images to the user and provide a summary of valid and orphaned files..

Jim Boyington, President, Vista Solutions Group, "I am proud of the continued efforts by our development team and believe the enhancements to netDMS are a testament to our dedication to not only our product lines, but also our innovative spirit. Our team looks forward to implementing netDMS version 2.13.0 throughout our client base during the upcoming year."

Long term goals for 2010 are being established to begin implementing netDMS version 2.13.0 within new and existing clients alike.
